Only two and a half percent of all water on the Blue Planet, Earth, is fresh water. Of that, only one percent of water is accessible for human consumption. Rivers are critical conduits for limited fresh water resources, in addition to hosting species, dividing and unifying political regions, use for transportation, and serving as beautiful natural areas for inspiration and recreation.

These maps show rivers and river basin boundaries from the Global Runoff Data Centre's (GRDC's) Major River Basins of the World dataset (2007). The "three largest" rivers in South America are defined by mean annual flow volume as provided by the GRDC.
